**Design**

- The Autoclavable Three Mirror 10mm Lens provides mirrors for the examination of the fundus and the anterior chamber angle.
- Three mirrors of 64°, 67° and 73° are arranged at 120° intervals.
- The small 64° mirror is inclined for gonioscopic procedures. It may also be used for the observation of the vitreous and the fundus near the ora serrata.
- The middle size mirror is inclined at 67° to observe the peripheral fundus from the ora serrata to the region of the equator.
- The largest mirror is inclined at 73° to observe the fundus from the equator to an area adjacent to the posterior pole.
- The posterior pole can be observed through the central axis of the lens.
- A small diameter contact surface for use without methylcellulose.
- The contact diameter of the OG3MAC-10 can be increased by attaching either the OACF-15(15mm flange diameter) or the OACF-17(17mm flange diameter).
