### Lens Design

- The Hoskins-Barkan Goniotomy Lens was primarily designed for transverse goniotomy surgery with the operating microscope, but can also be used as a diagnostic lens.
- The infant lens is oval and conical in shape, with a 10mm diameter magnified view of the anterior chamber and anterior chamber angle.
- The premature infant lens is the same in shape and design except the dimensions are 1mm smaller for premature infant surgery.
- There is also an adult size at 11.5 mm diameter.

### Cleaning & Disinfection
